

TASK = Install Prometheus and Grafana on Linux with Node Exporter

NAME = AKSHAY CHOUDHARY

We will update the system repository index by using the following command.

```
sudo yum update -y
```

switch to root user

```
sudo su -
```

Export the release of Prometheus

```
export RELEASE="2.2.1"
```

#1. Creating Prometheus System Users and Directory

We will have to create a Prometheus user named Prometheus and a Prometheus directory named as Prometheus.

Using below commands we can create a user and directory.

```
sudo useradd --no-create-home --shell /bin/false prometheus
```

```
sudo useradd --no-create-home --shell /bin/false node_exporter
```

```
sudo mkdir /etc/prometheus
```

```
sudo mkdir /var/lib/prometheus
```

#2. Update Prometheus user

As user groups and directories are created successfully which store the Prometheus data and files.

Now we will have to update the group and user ownership on the newly created directories.

By using the below command we update the ownership.

```
sudo chown prometheus:prometheus /etc/prometheus
```

```
sudo chown prometheus:prometheus /var/lib/prometheus
```

#3. Download Prometheus Binary File

Now we will download the latest version of Prometheus. We can copy the download link as per our Operating System from [Prometheus download page](#)

Using below command we can download Prometheus, here we are downloading Prometheus 2.26 version, you use above link to download specific version.

Navigate to **/opt** directory

```
cd /opt/
```

Download the Prometheus setup using wget

```
wget  
https://github.com/prometheus/prometheus/releases/download/v2.26.0/prometheus-2.26.0.linux-amd64.tar.gz
```

Now we have successfully downloaded the Prometheus file and now we will extract that file.

#4.Install Prometheus and Grafana on Linux

We can use sha256sum command line to generate a checksum of the Prometheus downloaded file.

We will also extract the downloaded file using the **tar** command.

```
sha256sum prometheus-2.26.0.linux-amd64.tar.gz
```

Output:

```
f1f2eeabbbf7822572dce67565dc96ffaa2dd1897dd1d844562552b11123f151a prometheus-2.26.0.linux-amd64.tar.gz
```

We have verify that the output from above command with checksum matches the sha256sum checksum which is on official Prometheus download page.

It will ensure that our downloaded file is not a corrupted file.

Now we will extract the Prometheus setup file using the following commands.

```
tar -xvf prometheus-2.26.0.linux-amd64.tar.gz
```

navigate to prometheus extracted folder

```
cd prometheus-2.26.0.linux-amd64
```

To check list of setup files

```
ls
```

#5. Copy Prometheus Binary files

Now we have two libraries in our directory i.e. Prometheus and promtool. We will have to copy that both libraries to our /usr/local/bin directory.

By following below commands we will perform the copy operation.

```
sudo cp /opt/prometheus-2.26.0.linux-amd64/prometheus /usr/local/bin/
```

```
sudo cp /opt/prometheus-2.26.0.linux-amd64/promtool /usr/local/bin/
```

#6. Update Prometheus user ownership on Binaries

Now we will update the user and group ownership on the binaries of Prometheus.

Using following commands we will update the user and group ownership.

```
sudo chown prometheus:prometheus /usr/local/bin/prometheus
```

```
sudo chown prometheus:prometheus /usr/local/bin/promtool
```

#7. Copy Prometheus Console Libraries

We will need to copy the console and console_libraries directories to /etc/Prometheus/.

Use below commands to copy console and console_libraries.

```
sudo cp -r /opt/prometheus-2.26.0.linux-amd64/consoles /etc/prometheus
```

```
sudo cp -r /opt/prometheus-2.26.0.linux-amd64/console_libraries  
/etc/prometheus
```

```
sudo cp -r /opt/prometheus-2.26.0.linux-amd64/prometheus.yml  
/etc/prometheus
```

#8. Update Prometheus ownership on Directories

Now we will update the user and group ownership on the directories to Prometheus user using -R.

By executing this commands ownership is set on is ensured. Execute the following commands.

```
sudo chown -R prometheus:prometheus /etc/prometheus/consoles

sudo chown -R prometheus:prometheus /etc/prometheus/console_libraries

sudo chown -R prometheus:prometheus /etc/prometheus/prometheus.yml
```

#9. Check Prometheus Version

Now the Prometheus is successfully installed on our system. We will check the version of Prometheus and promtool to configure it.

Follow the commands to verify prometheus version.

```
prometheus --version

promtool --version
```

Output:

```
ubuntu@ip-172-31-9-232:/opt/prometheus-2.26.0.linux-amd64$ prometheus --version
prometheus, version 2.26.0 (branch: HEAD, revision: 3caf58827d1ebd1a67749f88be4218f0bab3d8d)
  build user:   root@a67cafebe6d0
  build date:   20210331-11:56:23
  go version:   go1.16.2
  platform:     linux/amd64
ubuntu@ip-172-31-9-232:/opt/prometheus-2.26.0.linux-amd64$ promtool --version
promtool, version 2.26.0 (branch: HEAD, revision: 3caf58827d1ebd1a67749f88be4218f0bab3d8d)
  build user:   root@a67cafebe6d0
  build date:   20210331-11:56:23
  go version:   go1.16.2
  platform:     linux/amd64
```

#10. Prometheus configuration file

We have already copied **/opt/prometheus-2.26.0.linux-amd64/prometheus.yml** file **/etc/prometheus** directory, verify if it present and should look like below and modify it as per your requirement.

```
cat /etc/prometheus/prometheus.yml

# my global config

global:

    scrape_interval: 15s # Set the scrape interval to every 15 seconds. Default is every 1
    minute.
```

```
evaluation_interval: 15s # Evaluate rules every 15 seconds. The default is every 1 minute.
```

```
# scrape_timeout is set to the global default (10s).
```

```
# Alertmanager configuration
```

```
alerting:
```

```
  alertmanagers:
```

```
    - static_configs:
```

```
      - targets:
```

```
        # - alertmanager:9093
```

```
# Load rules once and periodically evaluate them according to the global  
'evaluation_interval'.
```

```
rule_files:
```

```
  # - "first_rules.yml"
```

```
  # - "second_rules.yml"
```

```
# A scrape configuration containing exactly one endpoint to scrape:
```

```
# Here it's Prometheus itself.
```

```
scrape_configs:
```

```
  # The job name is added as a label `job=<job_name>` to any timeseries scraped from this  
  config.
```

```
    - job_name: 'prometheus'
```

```
# metrics_path defaults to '/metrics'

# scheme defaults to 'http'.

static_configs:

- targets: ['localhost:9090']
```

#11. Creating Prometheus Systemd file

To run Prometheus as service we have to setting up prometheus, We will provide a path for both configuration file and data directory. We will start it with the Prometheus user using the following command.

```
sudo -u prometheus /usr/local/bin/prometheus \

--config.file /etc/prometheus/prometheus.yml \

--storage.tsdb.path /var/lib/prometheus/ \

--web.console.templates=/etc/prometheus/consoles \

--web.console.libraries=/etc/prometheus/console_libraries
```

Now we will create a system service file in **/etc/systemd/system** location.

```
sudo nano /etc/systemd/system/prometheus.service
```

After creating file successfully, copy the below files and it to the newly created file. **/etc/systemd/system/prometheus.service**

```
[Unit]

Description=Prometheus

Wants=network-online.target

After=network-online.target
```

```
[Service]

User=prometheus

Group=prometheus

Type=simple

ExecStart=/usr/local/bin/prometheus \

    --config.file /etc/prometheus/prometheus.yml \

    --storage.tsdb.path /var/lib/prometheus/ \

    --web.console.templates=/etc/prometheus/consoles \

    --web.console.libraries=/etc/prometheus/console_libraries

[Install]

WantedBy=multi-user.target
```

After adding the program save the file with **Ctrl+O** and exit with **Ctrl+X**.

To use the newly created service we will have to reload the daemon services, Use the below command to reload daemon services.

```
sudo systemctl daemon-reload
```

start and enable prometheus service using below commands

```
sudo systemctl start prometheus

sudo systemctl enable prometheus
```

We will check the Prometheus status whether it is running or not

```
sudo systemctl status prometheus
```

Output :-

```
ubuntu@ip-172-31-9-232:/opt/prometheus-2.26.0.linux-amd64$ sudo nano /etc/systemd/system/prometheus.service
ubuntu@ip-172-31-9-232:/opt/prometheus-2.26.0.linux-amd64$ sudo systemctl daemon-reload
ubuntu@ip-172-31-9-232:/opt/prometheus-2.26.0.linux-amd64$ sudo systemctl start prometheus
ubuntu@ip-172-31-9-232:/opt/prometheus-2.26.0.linux-amd64$ sudo systemctl enable prometheus
Created symlink /etc/systemd/system/multi-user.target.wants/prometheus.service - /etc/systemd/system/prometheus.serv
ice.
ubuntu@ip-172-31-9-232:/opt/prometheus-2.26.0.linux-amd64$ sudo systemctl status prometheus

```

Prometheus installation and configuration is set up, We can see status Active: active(running)

#12. Accessing Prometheus

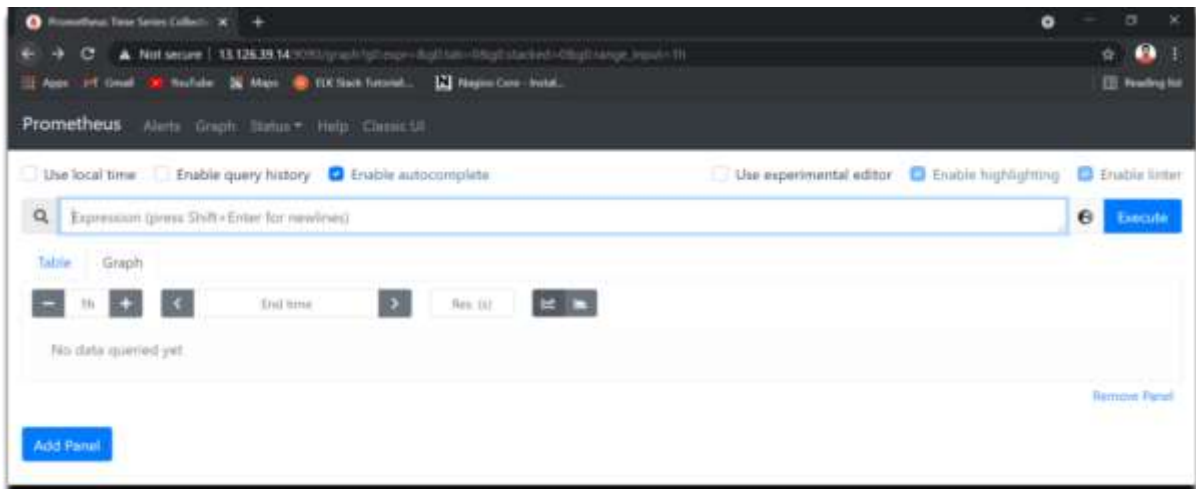

Now as Prometheus installation and configuration is set up and it is ready to use we can access its services via web interface. Also check weather port 9090 is UP in firewall.

Use below command to enable prometheus service in firewall

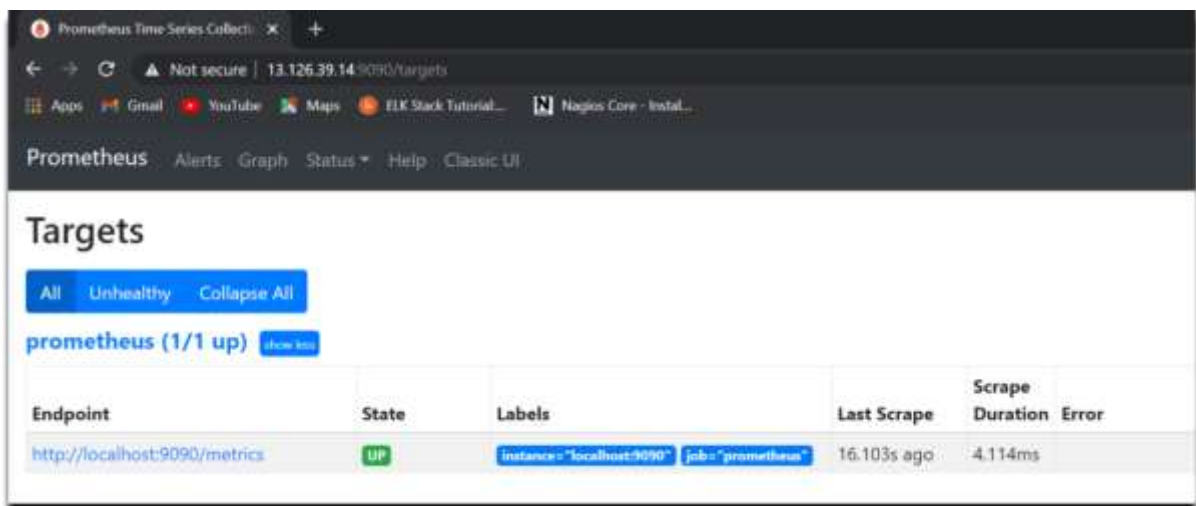

```
sudo ufw allow 9090/tcp
```

Now Prometheus service is ready to run and we can access it from any web browser.

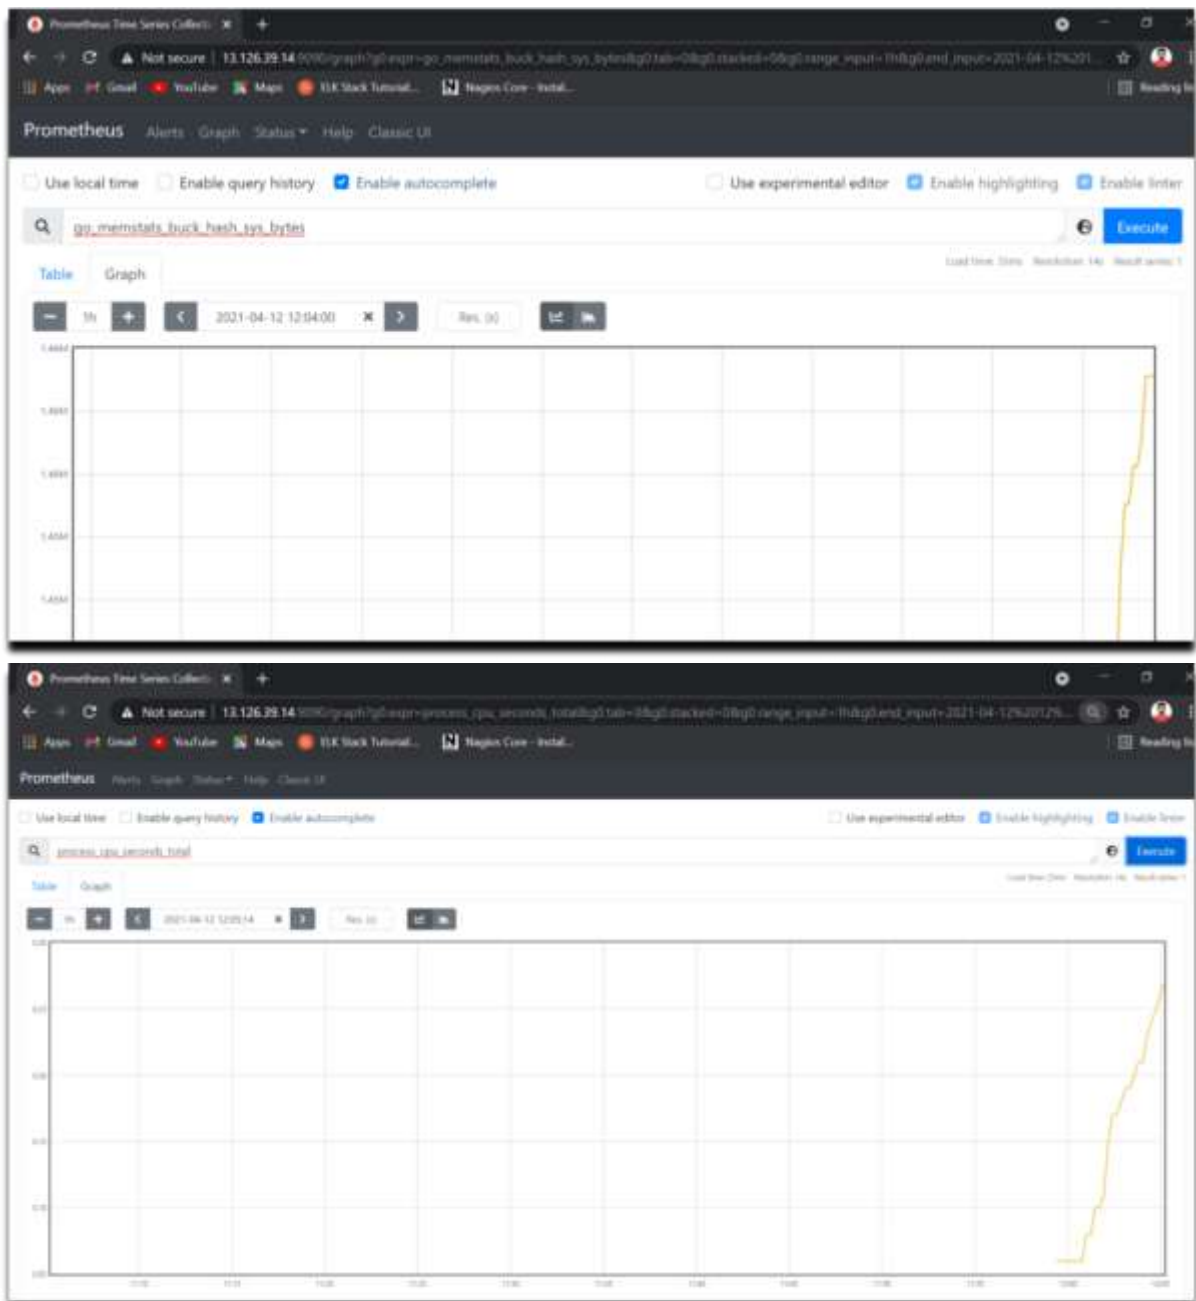

```
http://server-IP-or-Hostname:9090.
```

As we can see the Prometheus dashboards, we can also check the target. As we can observe Current state is UP and we can also see the last scrape.

Here are some snapshots of Prometheus dashboards and graphs.

#13.Install Grafana on Linux (CentOS, RedHat, Amazon Linux 2)

Now lets Install Grafana for wonderful dashboards and data visualization for monitoring systems, servers, services, etc

Add the Grafana YUM repo using nano

```
sudo nano /etc/yum.repos.d/grafana.repo
```

Add the below Grafana OSS repo into it, if you want use Enterprise version then visit [Grafana Official Page](#)

```
[grafana]

name=grafana

baseurl=https://packages.grafana.com/enterprise/rpm

repo_gpgcheck=1

enabled=1

gpgcheck=1

gpgkey=https://packages.grafana.com/gpg.key

sslverify=1

sslcacert=/etc/pki/tls/certs/ca-bundle.crt
```

update the system packages to take effect

```
sudo yum update
```

Now lets Install Grafana using below command

```
sudo yum install grafana
```

Now start the Grafana service using below command

```
sudo systemctl start grafana-server
```

Verify the Grafana Service Status using below command

```
sudo systemctl status grafana-server
```

Now finally enable the Grafana service which will automatically start the Grafana on boot

```
sudo systemctl enable grafana-server.service
```

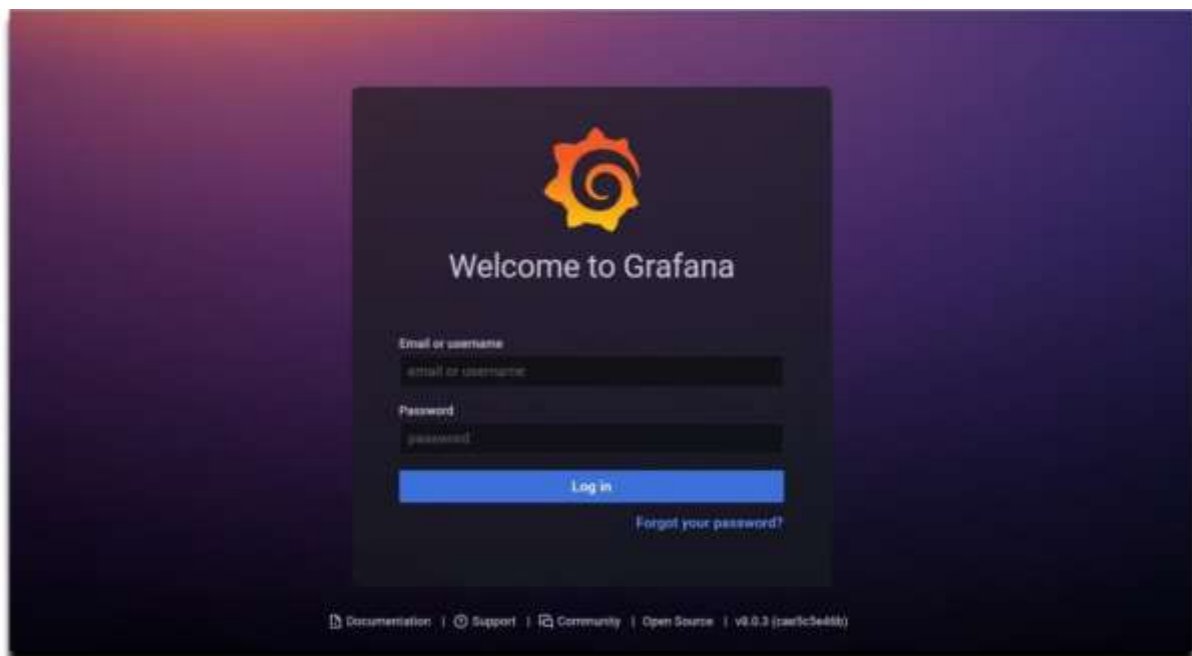

To access Grafana Dashboard open your favorite browser, type server IP or Name followed by grafana default port 3000.

```
http://your_ip:3000
```

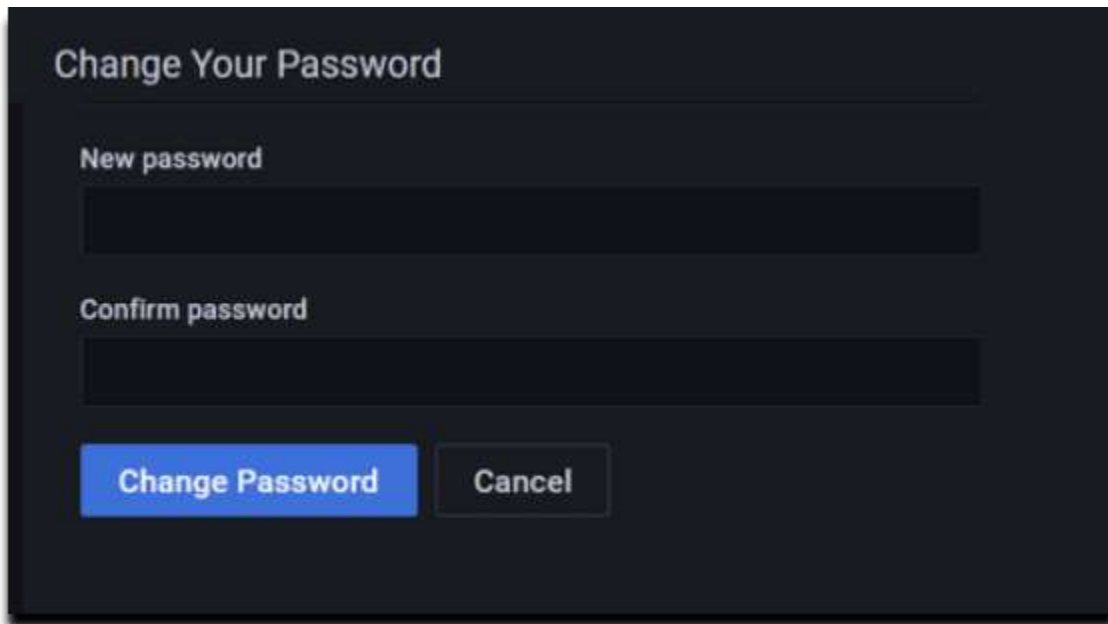

Here you can see Login page of Grafana now you will have to login with below Grafana default UserName and Password.

Username - **admin**

Password - **admin**

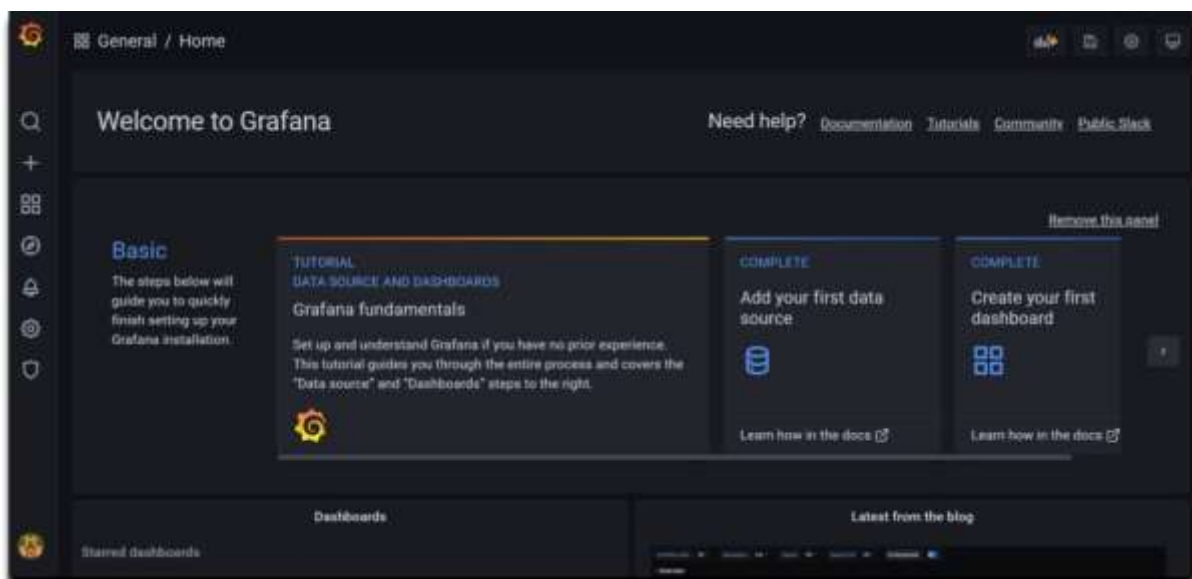

It is always a good practice to change your login credentials.

The image shows a dark-themed modal window titled "Change Your Password". It contains two input fields: "New password" and "Confirm password". Below the fields are two buttons: "Change Password" (highlighted in blue) and "Cancel".

Provide your New Password and click on **Change Password**

Now here you can see Home Dashboard page of Grafana

#14. Configure Prometheus as Grafana DataSource

Once you logged into Grafana Now first Navigate to **Settings Icon ->> Configuration ->> data sources**

General / Home

Configuration

Data sources

Users

Teams

Plugins

Preferences

API keys

Starred dashboards

Welcome to Grafana

Basic

The steps below will guide you to quickly set up your installation.

TUTORIAL
DATA SOURCE

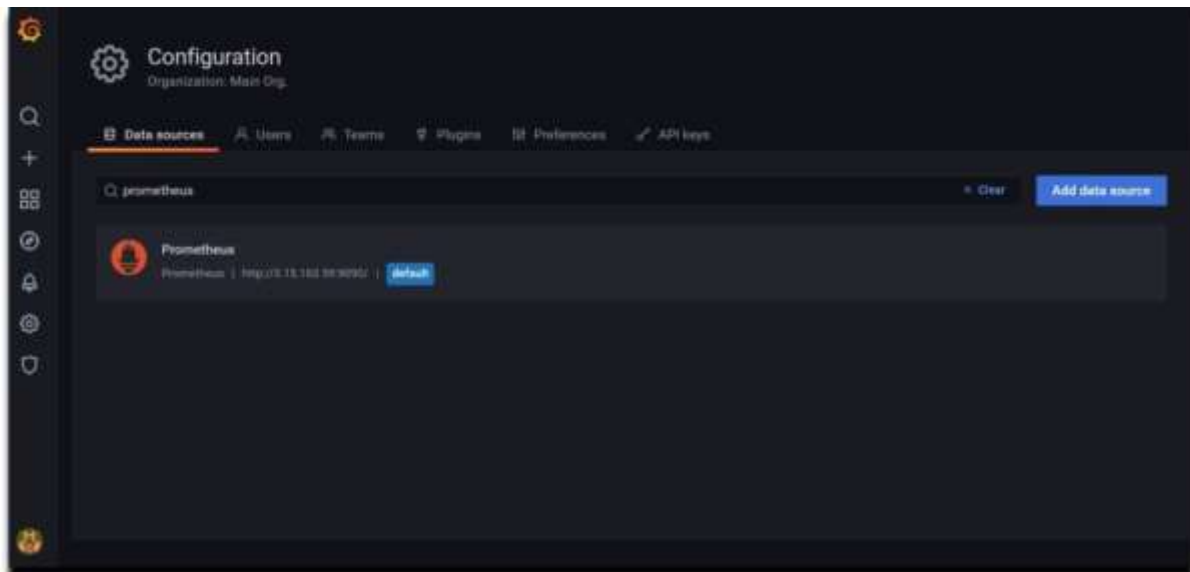

Grafana

Set up a
This tutorial
"Data source"

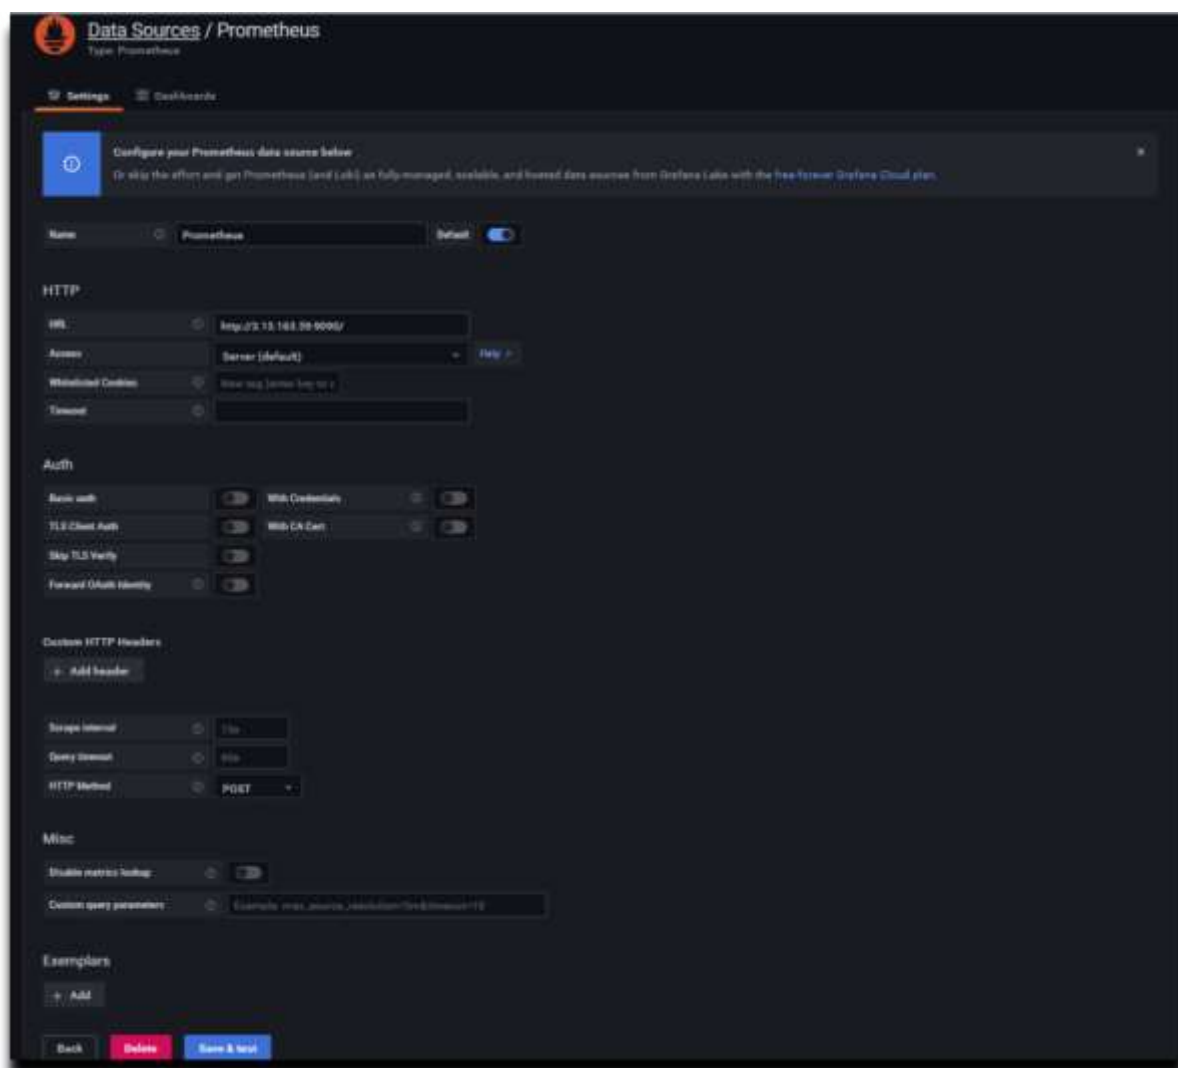

Dashboards

Now lets click on **Add Data sources** and select **Prometheus**

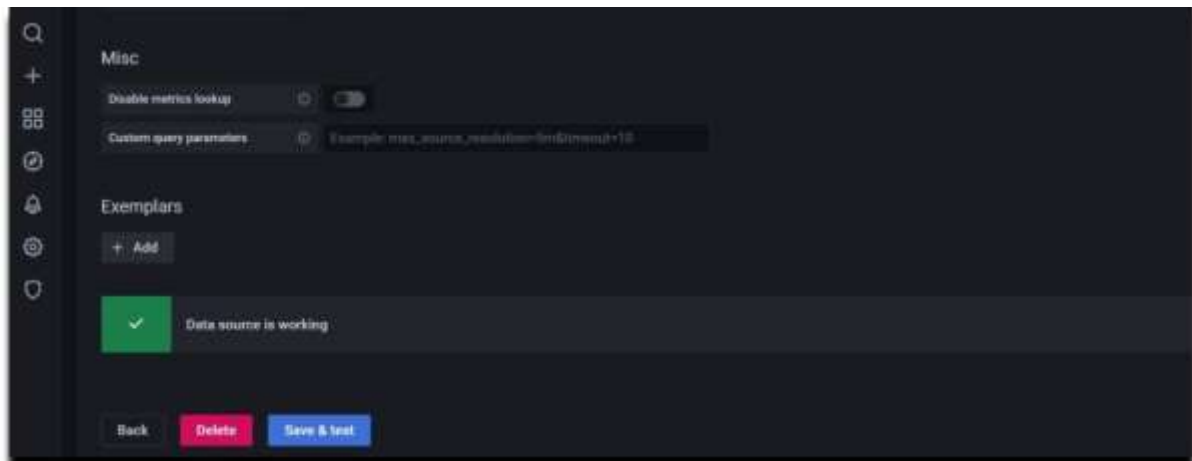

Now configure Prometheus data source by providing Prometheus URL

As per your requirement you can do other changes or you can also keep remaining configuration as default.

Now click on **Save & test** so it will prompt a message **Data Source is working**.

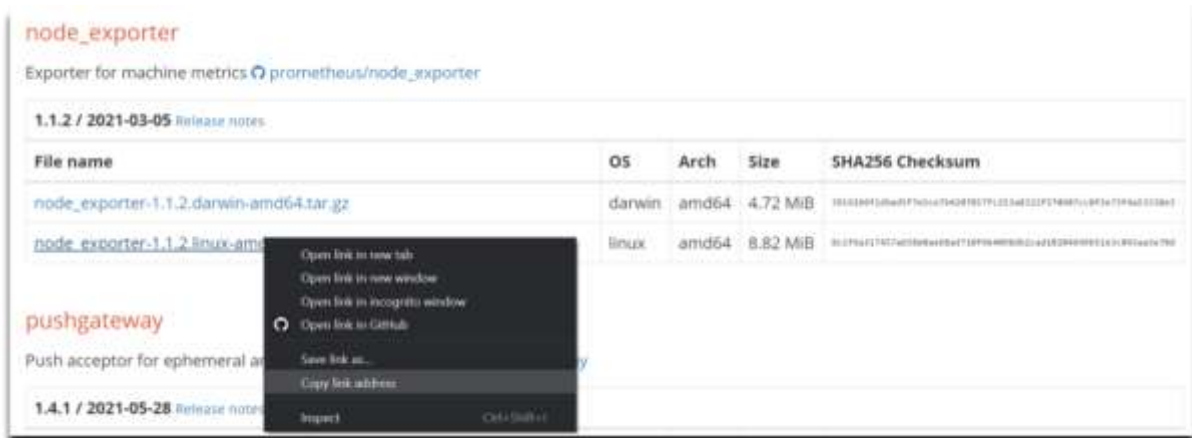

#15. Install Node Exporter on Linux (CentOS, RedHat, Amazon Linux 2)

Node Exporter collects the metrics of your system such as Memory usage, CPU usage, RAM, disk space, etc.

To install Node Exporter first navigate to [Prometheus official download page](#), Scroll down and you will get **node_exporter** section and then select Linux OS for amd64.

Now right click on node exporter and copy link address

Now lets run the copied URL with **wget** command

```
wget
https://github.com/prometheus/node_exporter/releases/download/v1.2.0/node_exporter-1.2.0.linux-amd64.tar.gz
```

Unzip the downloaded the file using below command

```
sudo tar xvzf node_exporter-1.2.0.linux-amd64.tar.gz
```

Now do **ls** and your can see node_exporter binary file.

Go to that file and move this file to your /usr/local/bin directory using below command

```
cd node_exporter-1.2.0.linux-amd64
sudo cp node_exporter /usr/local/bin
```

As early at the time of Prometheus installation we have created node_exporter user and also updated the ownership permission so we will not repeat it again

#16. Creating Node Exporter Systemd service

Now lets create a node_exporter service in /lib/systemd/system directory named node_exporter.service using below commands

```
cd /lib/systemd/system
sudo nano node_exporter.service
```

Paste the below content in your service file

```
[Unit]

Description=Node Exporter

Wants=network-online.target

After=network-online.target
```

```
[Service]

Type=simple

User=node_exporter

Group=node_exporter

ExecStart=/usr/local/bin/node_exporter \

— collector.mountstats \

— collector.logind \

— collector.processes \

— collector.ntp \

— collector.systemd \

— collector.tcpstat \

— collector.wifi

Restart=always

RestartSec=10s

[Install]
```

Now lets start and enable the node_exporter service using below commands

```
sudo systemctl daemon-reload

sudo systemctl enable node_exporter

sudo systemctl start node_exporter

sudo systemctl status node_exporter
```

We have covered How to Install Prometheus and Grafana on Linux with Node Exporter.

#17. Configure the Node Exporter as a Prometheus target

Now to scrape the node_exporter lets instruct the Prometheus by making a minor change in prometheus.yml file

So go to etc/prometheus and open prometheus.yml

```
cd /etc/prometheus  
  
sudo nano prometheus.yml
```

Now in **static_configs** in your configuration file replace the target line with the below one

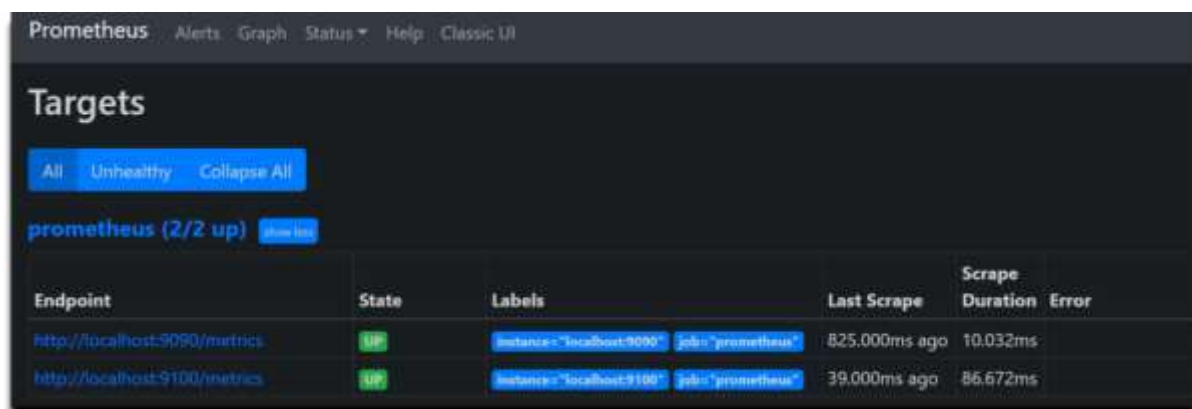

```
- targets: ['localhost:9090', 'localhost:9100']
```

Now restart the Prometheus Service

```
sudo systemctl restart prometheus
```

Hit the URL in your web browser to check whether our target is successfully scraped by Prometheus or not

```
https://localhost:9100/targets
```

The screenshot shows the Prometheus web interface with the 'Targets' tab selected. At the top, there are buttons for 'All', 'Unhealthy', and 'Collapse All'. Below these, it says 'prometheus (2/2 up)' with a 'Show log' link. A table lists the targets with columns for Endpoint, State, Labels, Last Scrape, Scrape Duration, and Error.

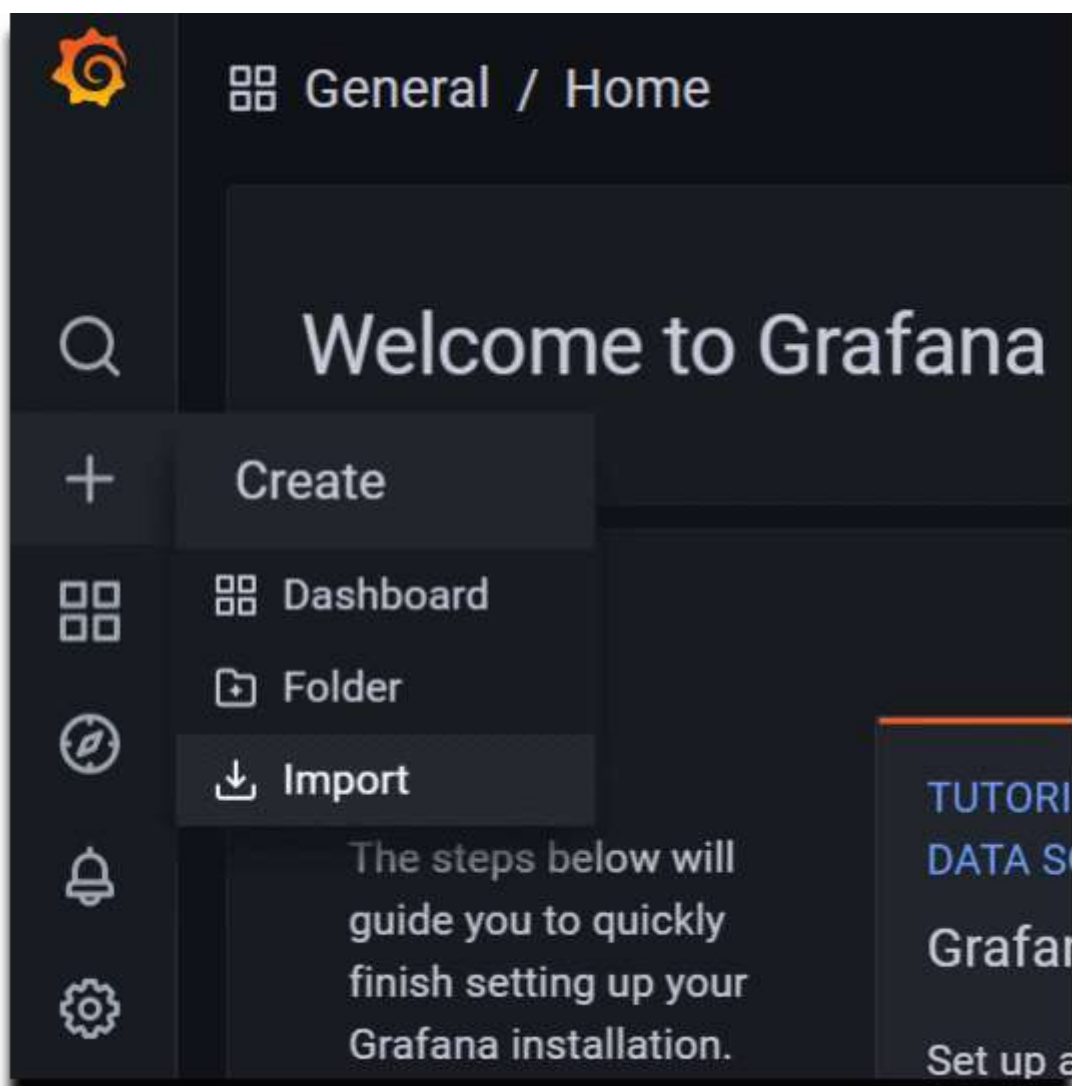

Endpoint	State	Labels	Last Scrape	Scrape Duration	Error
http://localhost:9090/metrics	UP	instance="localhost:9090" job="prometheus"	825.000ms ago	10.032ms	
http://localhost:9100/metrics	UP	instance="localhost:9100" job="prometheus"	39.000ms ago	86.672ms	

We have covered How to Install Prometheus and Grafana on Linux with Node Exporter.

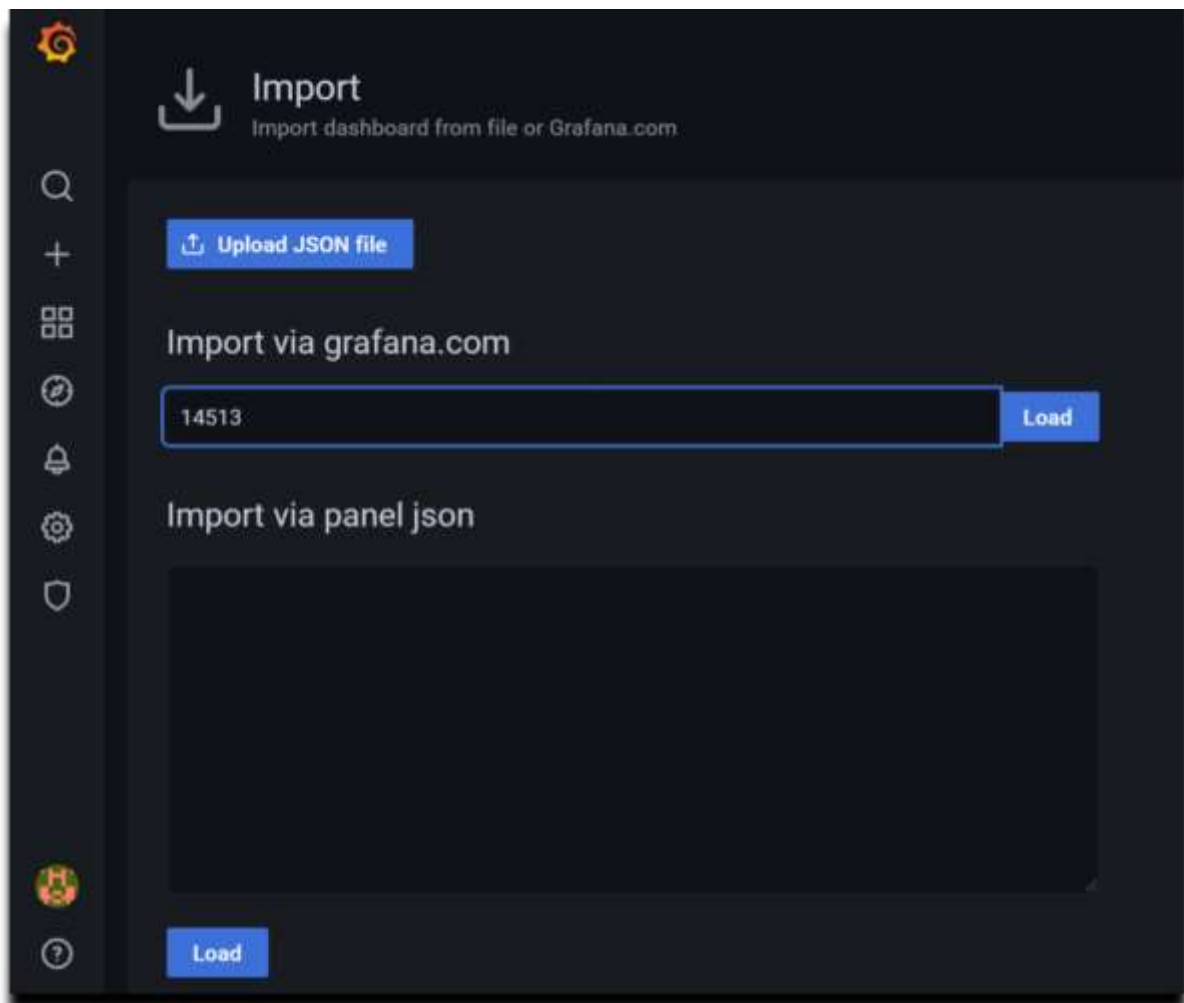

#18. Creating Grafana Dashboard to Monitor Linux Server

Now lets build a dashboard in Grafana so then it will able to reflect the metrics of the Linux system.

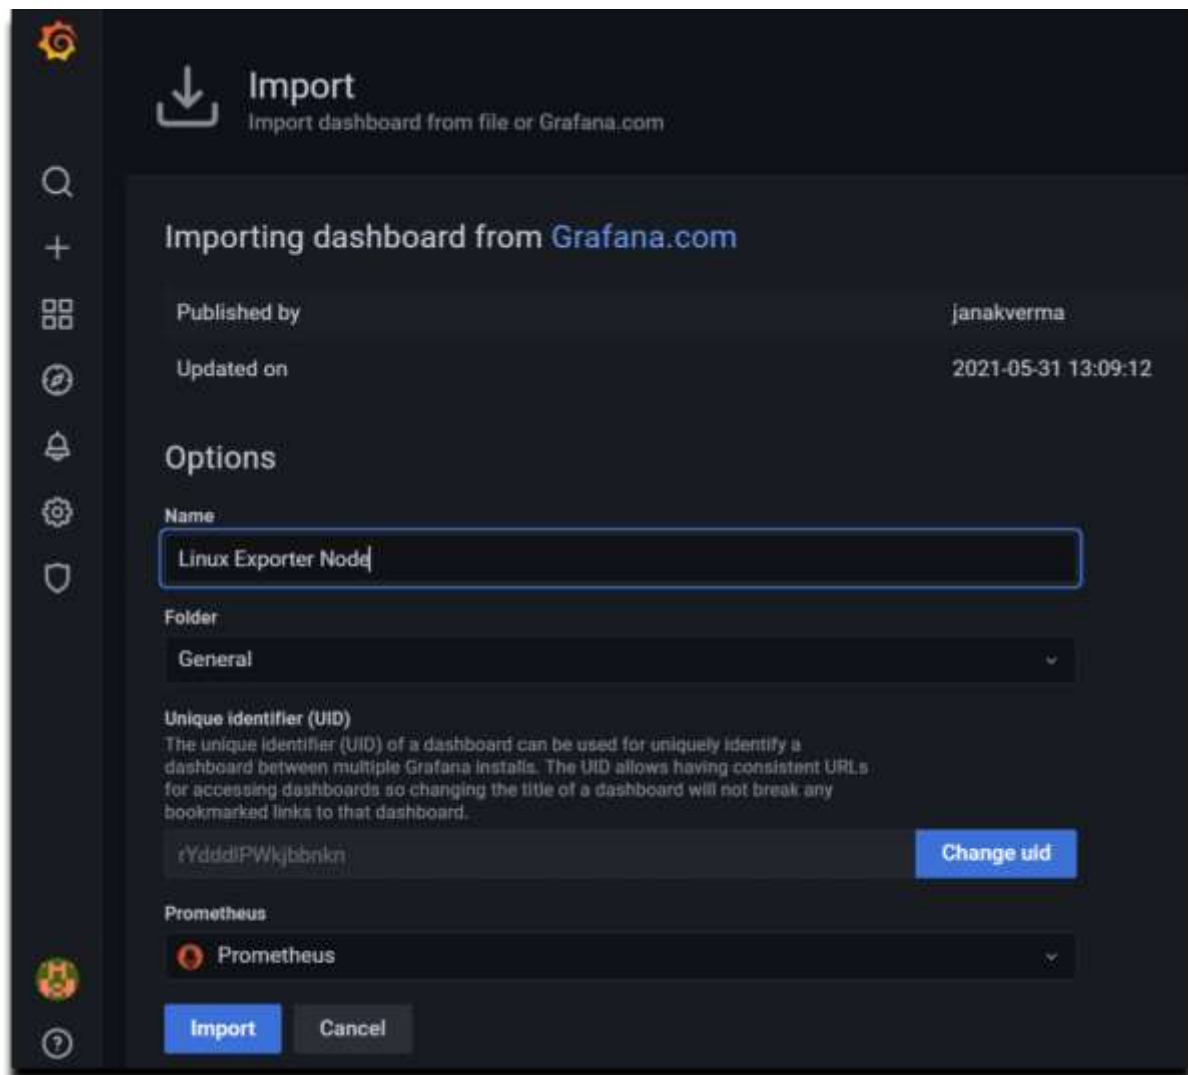

So we will use 14513 to import Grafana.com, Lets come to Grafana Home page and you can see a “+” icon. Click on that and select “**Import**”

Now provide the Grafana.com Dashboard ID which is **14513** and click on **Load**

Now provide the name and select the Prometheus Datasource and click on **Import**.

The image shows the Grafana 'Import' interface. At the top, there's a header 'Import' with a download icon and the text 'Import dashboard from file or Grafana.com'. Below this, the main heading is 'Importing dashboard from Grafana.com'. The interface is divided into sections: 'Published by' (janakverma), 'Updated on' (2021-05-31 13:09:12), 'Options', and 'Prometheus'. In the 'Options' section, the 'Name' field is 'Linux Exporter Node', the 'Folder' is 'General', and the 'Unique identifier (UID)' is 'rYdddlPWkjbbnkn'. A 'Change uid' button is next to the UID field. The 'Prometheus' section shows a dropdown menu with 'Prometheus' selected. At the bottom, there are 'Import' and 'Cancel' buttons.

Import
Import dashboard from file or Grafana.com

Importing dashboard from [Grafana.com](#)

Published by janakverma

Updated on 2021-05-31 13:09:12

Options

Name
Linux Exporter Node

Folder
General

Unique identifier (UID)
The unique identifier (UID) of a dashboard can be used for uniquely identify a dashboard between multiple Grafana installs. The UID allows having consistent URLs for accessing dashboards so changing the title of a dashboard will not break any bookmarked links to that dashboard.
rYdddlPWkjbbnkn [Change uid](#)

Prometheus
Prometheus

Import Cancel

There you are done with the setup. Now your Dashboard is running up!.

Conclusion:

We have covered How to Install Prometheus and Grafana on Linux with Node Exporter/Install Prometheus and Grafana on Linux (CentOS, RedHat and Amazon Linux 2), Monitoring Linux server with Prometheus and Grafana with Node Exporter.
